Description :

Bat Skeleton (Product Code: SLE/EZ/11) is a natural-bone bat skeleton used to show how a mammal's forelimb has been modified into a wing, in school biology and university zoology teaching. Mounted on a base with an acrylic cover, it comes with a key card that helps students put names to the bones. It is supplied by **Jain Scientific Equipments Pvt Ltd (ScienceLab)**, Ambala, India, for classrooms and teaching collections.

Key Details

Parameter	Detail
Specimen	Natural bone, mounted
Display	On a base with an acrylic cover
Included	Key card
Product code	SLE/EZ/11
Supplied by	Jain Scientific Equipments Pvt Ltd (ScienceLab), Ambala, India

What Is the Bat Skeleton Used For?

A bat's wing is essentially a hand: the upper arm and forearm bones are followed by greatly lengthened finger bones that stretch the wing membrane, while the short thumb stays free.Seeing this on a real skeleton gives students a clear example of homologous structures, the same basic set of bones reshaped for different jobs. The hind limbs, turned so the knees face backwards, also explain how bats hang upside down at rest.

Teachers use the bat skeleton in evolution lessons alongside a human hand and a horse forelimb, and in flight comparisons with a bird skeleton, where the wings look similar but are built very differently. The key card turns the specimen into a self-guided station for group work. Keep the cover closed, since the finger bones are slender, and store the mount somewhere dry and shaded.

Supplier

ScienceLab, the trading name of Jain Scientific Equipments Private Limited in Ambala, Haryana, supplies this bat skeleton to schools, colleges, universities and education dealers. It can be combined with other natural skeletons and comparative anatomy models in one consignment for customers in India and international markets. Visit the company profile to learn more.

Related Zoology Equipment

Specimens and models that support a homology or flight lesson with the bat skeleton:

- Pigeon Skeleton — a bird wing for comparing two independent routes to flight.
- Horse Forelimb Skeleton — a forelimb built for running, from the same basic bone plan.
- Human Skeletal Hand Model — the human version of the bones that form the bat's wing.
- [illegible]es.
