Description :

Infusion Arm Splint, Foldable, Adult (Product Code: SLE/DDS/08) is a foldable plastic splint used to hold an adult patient's arm in place during continuous intravenous infusions in hospital wards and treatment rooms. Its length extends from 43 to 53 cm, adjustable straps fix the arm outstretched in pronation or supination, and an optional strap/fixator can attach it to a bed. It is manufactured by **Jain Scientific Equipments Pvt Ltd (ScienceLab)**, Ambala, India.

Specifications

Parameter	Detail
Type	Foldable infusion arm splint
Patient size	Adults
Length	Adjustable; extendable from 43 to 53 cm
Arm fixation	Adjustable straps
Bed attachment	Optional strap/fixator available
Arm position	Keeps the arm outstretched and fixed, in pronation or supination
Material	Non-toxic, non-allergic plastic
Cleaning	Suitable for cleaning with hospital-grade disinfection products
Features	Padded support and fastening straps
Product code	SLE/DDS/08
Manufacturer	Jain Scientific Equipments Pvt Ltd (ScienceLab), Ambala, India

What Is the Infusion Arm Splint Used For?

During a long infusion, bending the elbow or wrist can kink the line or disturb the IV placement. The infusion arm splint helps keep the arm outstretched and in a fixed position, which is what nursing staff need when a line has to stay in place for hours, and its straps hold the forearm without tape wound around the limb.

Staff choose pronation (palm down) or supination (palm up) to suit the infusion site, extend the splint within its 43–53 cm range to match the arm, then close the straps. For a restless patient, the optional fixator can anchor the splint to the bed. Hospitals preparing a hospital or lab equipment tender in India can list the splint with giving sets and infusion stands in the same schedule.

What to Specify When Ordering

- Number of adult arm splints required
- Whether the optional bed strap/fixator is needed
- Related IV items to be quoted together, such as giving sets or an infusion stand
- Delivery destination
