Description :

The **Dropper Bottle, Amber** (Product Code: SLE/GBO/18) is a pipette-type dropping bottle in amber borosilicate glass that comes in packs of 6. Each bottle has a glass pipette dropper held in a high density polythene stopper with a dust-proof head and topped with a vinyl teat, so a reagent can be drawn up and released drop by drop without the bottle being left open. Made by **Jain Scientific Equipments Pvt Ltd (ScienceLab)**, Ambala, a maker of borosilicate laboratory glassware in India, it is a natural home for the light-sensitive solutions in an acid base indicator kit or a biology stain set.

Specifications

Parameter	Detail
Type	Pipette dropping bottle
Material	Borosilicate glass
Colour	Amber
Dropper	Glass pipette dropper with vinyl teat
Stopper	High density polythene, with dust-proof head
Stopper and teat resistance	Resistant to acids and alkalis
Heat resistance	Heat resistant
Chemical resistance	Chemical resistant
Pack	Pack of 6

Typical Use

The pipette design works differently from a screw-cap dropper: the user squeezes the vinyl teat, lowers the pipette into the liquid, releases to draw it up and then presses the teat gently to deliver single drops. The dust-proof head keeps the pipette clean when the bottle is closed, which is valuable on student benches where bottles are opened dozens of times in a practical. Amber glass protects photosensitive indicators, stains and silver-salt solutions, and a pack of 6 gives one bench or one group a matched, labelled set.

Squeeze the teat before the pipette enters the liquid, not after, to avoid blowing bubbles into the reagent. Never turn a bottle upside down or lay it on its side with liquid in the pipette, as the solution will run into the teat. Refill from the stock bottle rather than topping up with a different batch, and keep the bottles in a tray so they stay upright. These small items see heavy daily handling, which is why they appear on almost every list of educational laboratory equipment in India.
