Product Name :

Compression Balance

Product Code :

SLE/LB/04

Email : sales@scilabexport.com
Phone: +91-7082934803

Description :

The Compression Balance is a direct-reading dial scale: a load on its large pan compresses a spring, and the pointer swings across a wide view dial that a whole group can read at once. Its plastic moulded body suits quick weighing of everyday objects and samples in school science, home science and maths lessons.

Compression balance details

Parameter	Detail
Type	Compression (dial) balance
Dial	Wide view
Pan	Large
Body	Plastic moulded
Purpose	Quick, direct-reading weighing of everyday objects and samples
Capacity and graduation	Not stated in the current documentation
Product code	SLE/LB/04
Minimum order	10 units
Dispatch	Usually within 7 to 10 working days
Supplied by	ScienceLab (Jain Scientific Equipments Pvt Ltd), Ambala, India

Weighing and estimation lessons on the dial balance

Estimate, then weigh. Each group handles a piece of fruit, a book and a bag of sand, writes down an estimate of each mass, then places the item in the middle of the pan and reads the wide view dial. Comparing estimate and reading after each item shows pupils how their sense of grams and kilograms improves during the lesson.

Checking the dial with known masses. Add masses from a mass weighing set on tray to the pan one at a time and record the dial reading for each total. A graph of dial reading against known mass should be a straight line through zero; a bend or an offset shows where the scale reads high or low.

Squashed spring, stretched spring. Weigh one object on the compression balance and then hang it from a force meter, whose spring stretches instead of squashing. Both instruments respond to the pull of gravity on the object, while a two-pan beam balance such as the Roberval balance compares masses directly. Pupils convert between the readings and discuss the difference.
